

Breaking news, you can now turn Claude into your own personal AI super agent.

So game changing MCP agent actually allows you to insert integrations directly into your chat.

So you can basically create this crazy AI super agent that's connected to your Zapier, your PayPal account.

You can for example connect 7000 apps directly inside the chat of Claude and I'm going to show you exactly how to integrate it based on what's working for me.

You can see I've inserted already all of these tools directly inside the chat and I'll show you exactly how they work.

So for example, you can connect ChatGPT, e-mail, Discord, Google Docs, WordPress, Facebook, and it's crazy powerful.

Even ChatGPT in image generation, you can now directly do inside Claude.

So in this video, I'm going to reveal how to transform Claude into your personal business command centre by connecting thousands of apps through Zapier, creating customized workflows to save hours daily.

The new update from Claude, which is a new MCPS update.

Now, obviously MCPS have been here for ages, like a few months, at least since November, something like that.

But what's happened now is that directly inside the chat, you can now use MCPS inside the research, the deep research, and also you can integrate different tools directly inside cloud chat.

Let me show you exactly what I'm talking about.

So you can see here, for example, we've integrated PayPal directly inside the integration section and also ZAP here with 15 different tools.

It's pretty insane.

So you can see here for example, of integrated ChatGPT, open AI conversations, creating assistance, image generation, Discord posts, Google Docs, WordPress, Facebook pages, etcetera, even sending emails and creating calendar events I've created directly inside cloud.

And you don't have to use a desktop, you don't have to use cloud code or anything like that.

Super simple and you don't need to code at all.

You just go to cloud AI and then just ask it whatever you want to do.

All right, let me show you an example.

So if I say, OK, create a financial tracking system, right, where Claude connects to PayPal transaction data, monitors spending patterns, creates financial summaries, generates spending reports in Google Sheets and then provides financial insight, right?

You can see it's actually used the MCPS from PayPal to list all the transactions, the invoice creation features, and then create a PayPal financial tracking dashboard and an analysis report.

So if we click on this, for example, you can see we've actually created directly this financial analysis based on our PayPal spending.

Pretty crazy, right?

We can see our spending patterns.

This is all customized to my live account.

You can also see here, for example, it's created a financial analysis report.

So it's generated on May the 3rd.

And essentially it's just come up with an executive summary, monthly breakdown of how much we spend, our expenses, how much we're spending and where we're spending it.

And then additionally, what our daily spending habits are and also where our money is going.

So it's really crazy because now you've got like an AI agent that could take all the data, for example, from PayPal or any sort of tool and analyse it and create something 10 times

better.

But not just that.

You can then, for example, take your MCPS and even send emails or create schedules and that sort of thing.

So let me show you an example of that, right?

So if we go back to our profit boardroom, here's an example of the results.

So here we actually said, research MCP agents, then use my connected MCPS to do this.

Connect to Google dots to create customized study materials, generate daily free visualizations to illustrate complex concepts, schedule learning sessions on your calendar with specific topic focuses, and then create a progressive curriculum that builds on previous sessions, Right.

And what you can see here, this is using, by the way, it's all using the clawed Max package.

So you have to sign up to Claude Max to get this update.

But essentially here you can see it's now used Google Docs to create the document, created a detailed event inside our Google Calendar like you can see.

So it's actually generated an event inside our calendar.

And then it's used ChatGPT to generate an image.

So it prompted ChatGPT and Dolly created a URL for the image, which we can open up here to Create an e-mail about the curriculum, right?

So it's actually emailed myself and put digitally, and I'm pleased to share the progressively learning curriculum we've created, etcetera.

It's talked about the sessions that have been scheduled.

And then also if we Scroll down here and we say, OK, send me the Google Doc link.

All right, So it's connected to Google Docs as well.

We open it up and that sends us to the Google Doc with the curriculum for studying MCPS, right?

Really crazy stuff.

And we've done that all directly using the new feature from Claude.

Now, the one thing I'm going to say is you might notice before with the Dolly image option, that URL only stays live for a few minutes.

So when you come back to it, this URL right here is like a temporary URL.

So you have to get the image pretty quickly or just post it somewhere before it actually works.

But yeah, everything else is working perfectly.

It's crazy easy to set this up, so let me show you how you can do it.

First thing you're going to do, I've got a full recipe inside the Air Profit boardroom is obviously you're going to upgrade to the cloud Max plan.

So you just go to your settings, make sure you're on the Max plan, it's about \$150.00 a month, and then that's going to unlock for you Cloud research, which side?

Deep research and also custom integrations.

So if we go inside here and then we go to settings and then inside billing, you just want to adjust your plan to make sure that you're on the Max plan, right?

That's what we're on right here.

It's not cheap, but if it saves you time, if you're running a business, of course it's worth it.

Then from there you're going to create an MCP server via Zapier.

The thing is with Zapier, it connects to 5000 different apps, right?

And so that's a real easy way to set up one MCP for all the MCPS, for all the tools, etcetera, and just turn your, your existing cloud into a super agent.

So the way to do that is you just go to your Zapier MCP dashboard like you can see right here.

Then you're going to click on new MCP server in the top left.

And then you just configure it and set it up like you can see.

You can name it however you want.

And from there you're just going to start adding tools.

So if you want to add a tool, you click on Add tool over here, select whichever tools you want to connect.

And there's actually over 7000 apps you can connect here, including all the main ones.

So Gmail, Google Calendar, Forms, Notion, Google Drive, Asana, Slack, everything you can imagine almost is inside here.

And you can search as well.

So you can type in, for example, Stripe or PayPal, whatever you want, pretty cool stuff.

And then you can build custom automations, custom workflows using this process.

So once you've set up the MCP server inside Zapier, then from here you've got these connect options.

Now it's really easy to set this up inside cloud.

So what you do is you copy this URL like you can see, then you're going to go to Claude settings and once you've upgraded to the Max package, scroll all the way down, hit add more, and then type in the integration URL and whatever you want to name it.

So for example, like Zapier, whatever, right?

I've called it Zapier.

Then you're going to connect and log in using Zapier.

And from there you've basically got a AI agent that's ready to go, right?

We've your MCPS connected, so you can see all the MCPS right here.

Now, once you've connected them, then we can go to new chat and inside here, we're just going to click on the settings option.

Inside Settings, we Scroll down.

We've also got web search connected because we're on the Max plan.

And then from here, we've also got, for example, PayPal and Zapier as well.

So if we scroll out here, you can see, for example, all 15 tools that I've connected are inside here directly.

So if I say now inside Claude, OK, create an image of a cat eating biscuit inos, right?

It's going to use Daily Three's MTP to generate that response.

So you can see here it's prompting daily 3 to create the image.

Since I, I need to generate an image of a cute cat eating biscuits.

The cat should be sitting on the kitchen counter with some biscuits in front of us.

It's amazing that Claude is actually smart enough to figure out, OK, this is how we should really prompt the AI.

So instead of you speaking directly to the AI, you get Claude to speak to the AI.

And obviously Claude thinks like an AI.

He knows how to communicate with an AI.

You're going to get better results, right?

So that's what this is all about.

I said, let's wait for that to load now.

And in the meantime, once we've done that, we should get a response back from Dali 3 once we're done on that.

Now it's not using the new image 1 GPT.

But if you want more help on building apps, we've image one from GPT, which the new version of creating images.

Then you can check out my other videos on how to build apps with them.

For example, I actually built this tool using image 1.

You plug in your API key.

It's available at this address inside the air profit boardroom.

You plug in your prompts and you can generate thumbnails.

It's pretty crazy stuff.

Now, one thing I actually did because I wanted to test this myself was I pasted the transcript from my video yesterday about this new update.

And then I asked Claude to come up with eight different mind blowing MCP workflows that you can use.

So for example, like you could use a morning command center where you like, check my calendar for today's meeting, pull up the weather forecast, summarize important and unread emails, compile A personalized briefing, and then send it all to your inbox before you start your day.

And it's really easy and simple to do.

For example, if we go back to Claude here inside Zapier, we've got all of our tools connected.

The only thing that we do need to connect is an extra.

And this is good because I'll show you how to connect and add to tools.

So if we click on add tool here, we'll type in Gmail, we'll plug in Gmail and then we're going to say find emails.

So we're going to allow the find emails tool like you can see, and that's just going to look through my e-mail inbox and find stuff.

So if we go now back into my settings and every time you add a tool, you just have to disconnect and then reconnect Zapier.

So if we Scroll down here, we'll disconnect because it's only got 15 tools.

It's not got the new one I just added.

We'll click on connect now, hit allow, and then if we click on view your integrations, we've got that ready to go.

Mattheo says love Claude MCP, me too.

And Jesse James says great content, bro, respect.

Appreciate it.

Thank you so much.

All right, so if we Scroll down here, we've got 16 tools.

Previously we have 15 tools, now we have 16.

So if we go inside here, we can use this to generate our response and say check my calendar for Sunday's meetings, pull weather forecast from and I'll put for Manchester, UKI know the weather's not going to be good, but we'll just do this as a demo.

I'm going to say summarise important unread emails, compile A personalized briefing document in Google Docs and send me a link and then send it all to my inbox.

All right, so we'll do that.

Now it's going to pop up with a message saying will I allow MCPS from Claude?

I think let's see what we get.

There we go, right, This is found the events from the calendar.

It's got the weather forecast from Manchester.

We're going to allow that now it's going to check important emails, right?

And you can see how it's using the MCP each time, right?

So Google Calendar find event tool, then it's searching the web.

So it's doing the web search feature here.

Then it's going to check important emails using the Gmail find e-mail option, right?

And each time it's just using it's kind of super agent functionality to look for my inbox or to

check for my calendar and that sort of thing and then come back to me of the answers.

Now, this doesn't always work super smoothly.

So for example, if you actually look over a video that I did yesterday, you'll see that when I tried to connect this to WordPress, it totally failed, right?

So some integrations, very early days don't work, right?

And they probably work in the future, but right now they don't work some of them.

So just bear that in mind.

What you can also do is just connect your Gmail here.

So if we click on connect Gmail, we can add the Gmail here.

So allow that in and then we can use that as well.

Now you can see a summary of complete tasks.

So it's on the calendar check for the task scheduled, the weather forecast, the e-mail summary and the briefing document along with the e-mail delivery as well.

So if you open up this link inside Google Docs here, we've got the daily briefing.

If we open up this e-mail, you can see the daily briefing right here with the Google Doc attached, right?

And that was super easy.

The only thing that didn't quite work was the e-mail summary, which I probably need to fix it and just go back and check the integrations on that, which is fairly simple and easy to do.

But you can see it has got access to my emails, it can send emails, it can create Google Docs, etcetera.

Really powerful stuff.

The other thing that you can do inside your sense here is you can connect SSE.

So you can see, for example, with PayPal, the way that I connected that this is pretty simple and easy to do.

So you're just going to click on integration URL and you can Google the information if you want.

You can see here how it works, etcetera.

And then you can just grab the SSE.

So for example, for PayPal, we can copy that from the update.

Then we're going to go over to Claude integrations, plug in the URL, plug in the name, so for example, PayPal, and then you can add it like so.

We've already got the integration added, but that's how you would add it and then you just log in with PayPal, right?

Same with, for example, like Asana, which would be pretty cool, Cloudflare, Atlassian as well.

But yeah, there's just so much you can do with this.

I think most people don't even realise they can do it.

They have a cool thing as well.

If we toggle research on, so this is a deep research agent, we can, for example, say, OK, research the latest AI updates this week as a deep research report, then put into a Google Doc and e-mail it to me, all right?

And we've got research toggle down here, which means it's going to use a deep research plus it's going to use the integrations that we've set up, right?

So it's the only tool that I know of where you can actually not just do deep research, but you can also connect that to Google Docs or to, for example, e-mail and that sort of thing.

OK, so I'm just going to say, OK, just figure this out yourself.

And then you can see here it says Claude may use the following custom integrations whilst researching PayPal, all these other tools that have connected, blah, blah, blah.

And then we can click on research with those tools and it would just go off and do it.

If you want to stop, click stop in the bottom right.

Now, the other interesting thing about this is you can basically turn this into an AI super agent.

For example, if you're using something like Manus, Manus is kind of like a Claude wrapper, but a lot of the tools that are connected inside Manus you could now use inside Clot as well, right?

If you know how to set this stuff up.

So I'm going to stop that research for now.

And then we're going to go into a new chat and we'll use this prompt.

So I'm going to say I need a seven day itinerary, blah, blah, blah, which is one of the main prompts from Manus.

And then we'll say, please provide a detailed itinerary.

We'll click on the research option here, and it can do exactly the same thing.

But you could then plug that into Google Docs or into e-mail and that sort of thing, right?

And so you can turn into kind of like your own version of Manus, but it's more customized to you because it's already logged into all your tools, all your integrations.

And I think one of the biggest things that I struggle with is figuring out, OK, what are the best tools to connect to Zapier and make those work.

So if for example, you can then use this more and more, you're going to develop that muscle of, OK, here's the opportunities.

Here's how I can use it, right?

You got to train this muscle to figure out, OK, how can you use this?

What are the possibilities and limitations and everything else.

So that is basically it for me folks.

If you want to get the full SAP templates, tutorials, etcetera.

If you want to see more stuff on Manus and super agents in general.

So you can see here, for example, we've got tons of training on super agents like Manus open Manus OWL Root code computer use.

We'll let Genspark in there, Retriever AI and a brand new one called Scout as well as this clawed SAP as well.

Then feel free to get that inside the AI profit boardroom.

These are all like video tutorials, courses, templates, workflows, etcetera.

Comes with all my best prompts and basically the whole community.

The whole goal here is like for everyone who joins to make more money and save time with AI, right?

So you can scale your business so that you can really take advantage of it in a practical way based on what's working for us.

So all the systems that we share inside the crash course here, for example, we've implemented inside our own business to scale, to grow and to get more customers to to keep our customers longer as well.

So feel free to join the AI profit border and you can also post inside the community here.

It also comes with weekly Q&A calls.

So you can jump on the live calls, ask any questions you have.

And if you miss any of the Q&A calls, you can just watch back the call recordings right here.

So thanks so much for watching, appreciate it.

And if you want to get a free one to one SCO strategy session that gives you a custom tailored game plan to get more free leads, more customers, more sales with EO, feel free to get that link in the conference description.

Appreciate you watching as always and I will see you on the next one.

Cheers.

Bye bye.
